How do drugs cross membrane barriers?

Active transport

OPINION

Carrier-mediated cellular uptake of pharmaceutical drugs: an exception or the rule?

Paul D. Dobson and Douglas B. Kell

Abstract | It is generally thought that many drug molecules are transported across biological membranes via passive diffusion at a rate related to their lipophilicity. However, the types of biophysical forces involved in the interaction of drugs with lipid membranes are no different from those involved in their interaction with proteins, and so arguments based on lipophilicity could also be applied to drug uptake by membrane transporters or carriers. In this article, we discuss the evidence supporting the idea that rather than being an exception, carrier-mediated and active uptake of drugs may be more common than is usually assumed — including a summary of specific cases in which drugs are known to be taken up into cells via defined carriers — and consider the implications for drug discovery and development.

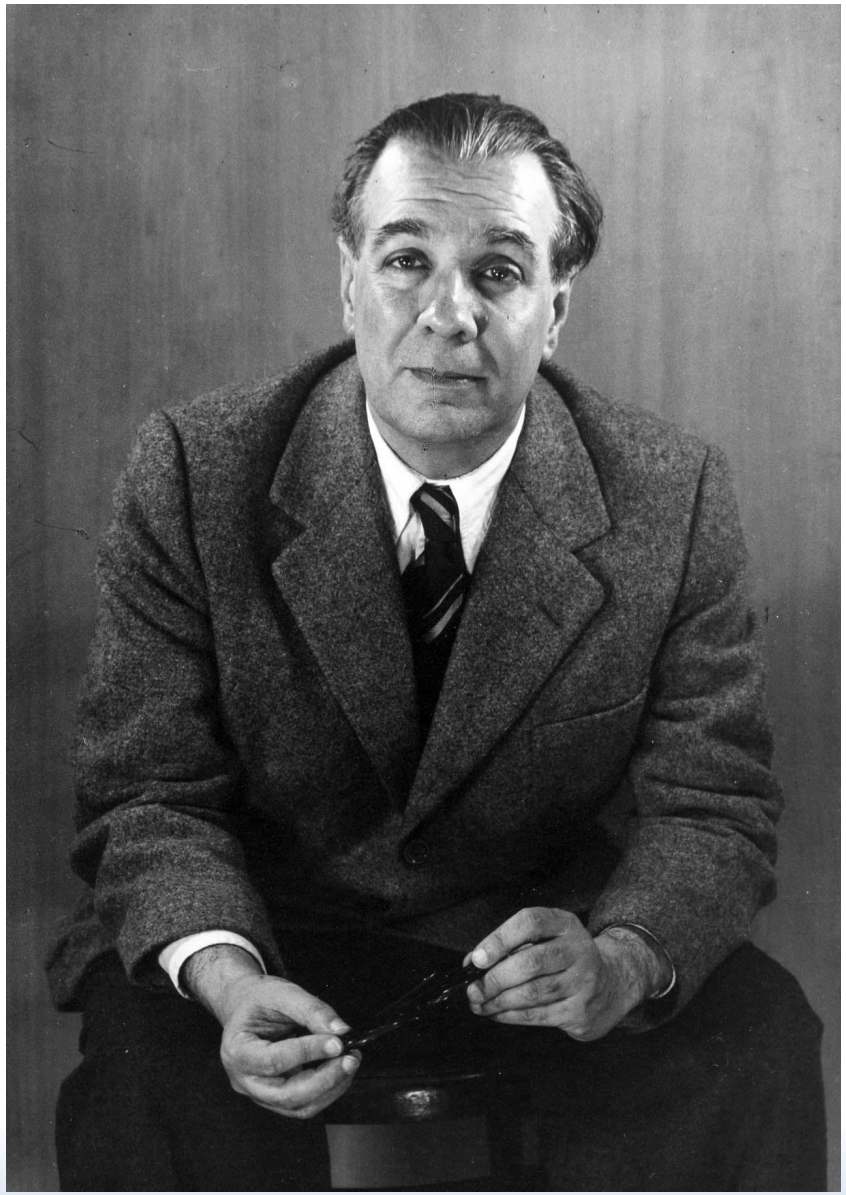
Jorge Luis Borges: Predictor of Orion path sampling



Credit: wikipedia

***Garden of Forking Paths*, 1941**

"I imagined it infinite, made not only of eight-sided pavilions and of twisting paths but also of rivers, provinces and kingdoms. ... I thought of a maze of mazes, of a sinuous, ever growing maze which would take in both past and future and would somehow involve the stars."

Conclusions and future directions

Conclusions and future outlook

Permeability coefficients can be estimated from models, experiments, and MD methods. However:

P_m estimate ✓ P_m mechanism ⊘

We developed a floe using a kinetic model for permeability based on WE path sampling that relies on the kinetic rate constant for membrane permeation:

P_m estimate ✓ P_m mechanism ✓

Our method works well for a few Ro5 molecules; we would like to expand to bRo5 molecules and the BBB as well.
